

# SCADA Telemetry

Exa Networks can provide you with a solution that delivers failsafe connectivity and provides access to your SCADA telemetry all of the time, which is essential for wind farms to successfully operate.

This solution incorporates underground fixed cable broadband and a 3G backup service. Because SCADA telemetry is concerned with outbound traffic only; it is the **upstream** part of the connection which is most important.

The information below is based upon your specific requirements and results in a bespoke solution designed to deliver you enough upload capacity at all times to enable your business to run as it should.
